

GREEN ROOF KIT

The materials you need for a green roof

Transform your extension, garage or shed flat roof into a green roof. The **Green Roof Kit** has the materials you need to prepare your roof for the turf, sedum or suitable plants that you choose.

The kit contains Oldroyd Xv20 GreenXtra, a dark green studded drainage membrane with perforations. It holds some rainwater but prevents waterlogging of the roof. The Oldroyd Typar filter fleece goes on top to retain the soil, and the root barrier membrane goes underneath to protect the roof waterproofing.

The **Green Roof Kit** provides materials to cover up to 9m². In the kit you will find:

- ◆ 1 x Oldroyd Typar Filter Fleece (2m x 5m)
- ◆ 3 x Oldroyd Xv20 GreenXtra sheets (2m x 1.5m)
- ◆ 1 x Root Barrier Membrane (2m x 5m)

A step-by-step illustrated guide to creating a green roof is also enclosed with the **Green Roof Kit**. Roof soil and plants are available from local garden centres and specialist suppliers, or contact us on 01403 210204.

Remember: Preparation is key! Make sure your roof surface is brushed clean of debris and has a good quality intact waterproofing layer free of defects before you start. There should be some form of perimeter drainage or guttering for rainwater run-off, and the structure should be strong enough to support your choice of plants.

For more information just contact our technical helpline on **01403 210204**.
